

Linear optimization (Linear Programming) simplex

NO ESCRITO POR MI.

Este programa resuelve problemas de optimización lineal de la forma:

$$\text{Maximiza } c^T \cdot x$$

$$\text{Sujeto a } Ax \leq b$$

$$x \geq 0$$

```
// This program was written by jaehyunp and taken from:  
// https://github.com/jaehyunp/stanfordacm/blob/master/code/Simplex.cc
```

```
// Two-phase simplex algorithm for solving linear programs of the form  
//  
//      maximize      c^T x  
//      subject to    Ax <= b  
//                  x >= 0  
//  
// INPUT: A -- an m x n matrix  
//        b -- an m-dimensional vector  
//        c -- an n-dimensional vector  
//        x -- a vector where the optimal solution will be stored  
//  
// OUTPUT: value of the optimal solution (infinity if unbounded  
//        above, nan if infeasible)  
//  
// To use this code, create an LPSolver object with A, b, and c as  
// arguments. Then, call Solve(x).
```
